PANORAMA DRILLING RESULTS FROM THE YORK-VIKING GOLD ZONE

(Vancouver, Canada), Goldcliff Resource Corporation reports significant assay results from the drilling at the Panorama Ridge property, York-Viking gold zone, in the Hedley Gold Basin, British Columbia, Canada. In 2005, Goldcliff drilled 1,211 metres in 13 core drill holes. The drilling results confirm that there is continuous gold mineralization at Panorama Ridge, as gold mineralization occurs throughout the York-Viking zone. The York-Viking gold zone drilling results that relate to section 10000N are highlighted by 0.95 grams per tonne gold (g/t) over a drill intercept of 74.52 metres (m) -- the highlight of which is 1.52 g/t gold over 28.00 metres.

The significantly strong drilling and trenching results at the York-Viking gold zone (YVZ) successfully establishes that gold mineralization occurs concurrently at depth and on the surface. Section 10000N in the YVZ has the most drill holes to demonstrate the continuity of gold grades at depth. The following table lists previously released holes (23003) and current holes (25040) for section 10000N:

DDH (#)	From (m)	To (m)	Interval (m)	Au (g/t)

The drill hole data for section 10000N are as follows:

DDH (#)	Easting (Utm)	Northing (Utm)	Azimuth (°)	Dip (°)	Depth (m)
23003	284106.25	5473166.20	320	-65	123.48
23004	284106.25	5473166.20	140	-45	135.94
25040	284106.25	5473166.20	320	-80	99.67

25045	284129.00	5473128.00	140	-60	96.67
23005	284154.66	5473103.21	320	-60	111.81
23006	284154.66	5473103.21	140	-60	125.22

Addition assays for the remaining drills holes for the YVZ and the Nordic zones are pending.

In summary, gold results are consistent with the Panorama gold deposit model – a world-class, sedimentary, strata-bound gold skarn deposit. The gold mineralization at YVZ occurs concurrently on the surface and at depth. The drilling results and the geology of the drill holes indicate the possibility of deeper gold mineralization beyond the current drilling depths.
