AUGUST 03, 2007

## PANORAMA RIDGE DRILLING IN PROGRESS

(Vancouver, Canada) Leonard W. Saleken, Chairman of Goldcliff Resource Corporation (GCN.TSXV), is pleased to report that the 2007 exploration program at Goldcliff's 100-per-cent-owned Panorama Ridge gold project near Hedley, British Columbia, Canada, is in progress. Goldcliff's exploration objective for 2007 is to advance the property from the gold-discovery-exploration-drill stage to the gold-resource-definition-stage on the York-Viking and Nordic gold zones.

Goldcliff having identified the gold mineralized zones in the previous gold-discovery-exploration-drill stage, the gold-resource-definition-stage will measure the volume of gold content in these zones. The Company is confident that the gold mineralization encountered at the York-Viking and Nordic gold zones in surface trenching and in drilling represents potentially economic gold grades. To achieve Goldcliff's objective, the Company is planning a 10,000 metre diamond drilling program on the York-Viking and Nordic gold zones.

The Panorama Ridge drilling commenced on the York-Viking zone with 30 core holes (3,000 metres) initially planned. Gold mineralization from the trenching and drilling at the York-Viking zone can be measured over a surface area of 250 metres by 500 metres, and to depths of 100 metres. The gold mineralization on surface is open to the southwest and northeast along Panorama ridge, a prominent topographic feature (1,900 metres ASL) on the property where the York-Viking gold zone occurs. The central area of the zone contains surface gold mineralization of 1.00 g/t over 170 metres in a northwest direction and 0.72 g/t over 283 metres in a southwest direction.

In 2006, two drill-holes intercepted significant gold mineralization on both-ends of the central area of the York-Viking zone. To the southwest, hole 26073 intersected 1.49 grams per tonne gold (g/t) over 26.7 metres. To the northeast, hole 26072 intersected 2.04 g/t gold over 20.1 metres. These two holes are strategically located in the York-Viking zone. A trench 200 metres southwest of hole 26073 contains 1.24 g/t gold over 13.0 metres. A trench 150 metres northeast of hole 26072 contains 2.95 g/t gold over 1.0 metres. This surface area of gold mineralization on the York-Viking gold mineralization zone has not been drilled. The 2007 York-Viking drilling will test the surface extension of the gold mineralization by trenching and drilling. The majority of drill holes on the York-Viking zone will focus on infill drill-holes for the gold-resource-definition stage.

Prior to drill mobilization on Panorama Ridge, Goldcliff had completed surface trenching on the York-Viking zone consisting of 374 metres of diamond-saw-cut-continues-channel samples in seven trenches at 1.0 metre sample intervals. All of these trenches have been sampled and the samples are in for assay.

Leonard W. Saleken, PGeo, geologist, is the qualified person as defined by National Instrument 43-101 who supervised the preparation and verification of the technical information in this release.
