## **Goldcliff Confirms New Targets at Panorama Ridge**

(Vancouver, BC) George W. Sanders, President, Goldcliff Resource Corporation (GCN.TSXV), reports recent sampling on the company's 100% owned Panorama Ridge gold property located in the Hedley Porphyry Gold Camp has shown anomalous gold values are associated with two previously unexplored geophysical targets. The geological mapping and rock and drainage geochemical sampling programs were initiated in September to test several strong 3D IP chargeability anomalies. The rock samples returned gold values of up to 2.37 ppm and the drainage samples returned gold values of up to 23.6 ppm.

Several distinct, close spaced chargeability highs, covering an area approximately three square kilometres, are clustered around the large Epic zone of very high intensity chargeability. The Epic zone has been benign of gold values. The anomalous chargeability area is four kilometres from the historic high grade Nickel Plate Mine and the bulk tonnage Mascot open pit mine that have produced 2.25 million ounces of gold. Two chargeability anomalies to the south of the Epic zone, the York-Viking and Nordic zones, have yielded consistent surface and subsurface gold mineralization with grades ranging from 0.50 g/t to over 2.00 grams.

Two previously untested chargeability targets to the northwest of the Epic were explored by collecting rock and drainage samples. The overlapping gold, silver, arsenic, bismuth, copper, tellurium and tungsten rock and drainage anomalies indicate that these areas are high priority for further exploration. During the September program 79 drainage samples and 59 rock samples were collected.

The rock and drainage samples at Panorama Ridge contain metals that are associated with Porphyry Gold Deposits around the world. These metals are Au, Bi, Te, W, Mo, As, Sb, Sn, Pb, and Cu.

Several kilometres south of the Panorama Ridge geophysical anomalies, rock sampling at the historic French and Good Hope mines have established these areas as additional high priority targets. Sampling at the Good Hope yielded 9.42 g/t gold and the French yielded 7.57 g/t gold in outcrop.

The technical information has been reviewed by Leonard W. Saleken, PGeo.
